

WAZUH EDR CAPABILITY EVALUATION

Multi-Stage Attack Simulation & SIEM Detection Analysis

WAZUH AGENT DEPLOYMENT — WIN10 ENDPOINT ACTIVE

EXECUTIVE SUMMARY

Detection Coverage Validated Across a Full Attack Chain

This assessment evaluated a Wazuh-based SIEM's ability to detect, log, and respond to a sophisticated multi-stage attack against a Windows 10 endpoint.

1,164

Correlated Events (24h)

100%

Attack Phase Coverage

<1 sec

Alert Latency

5 / 5

MITRE Tactics Detected

CRITICAL RESULTS

- Real-time alert generation at sub-second latency
- Effective parent-child process chain correlation
- Complete forensic artifact preservation & timeline reconstruction
- False positive rate of 26% — primarily compliance scanning
- Overall Risk: LOW (with recommended enhancements)

1,164 CORRELATED ALERTS — 24-HOUR WINDOW

ASSESSMENT SCOPE & ENVIRONMENT

Three-Node Simulation Environment

SIEM Management Server

Ubuntu 20.04 LTS · 192.168.0.102

Wazuh v4.14.6 · 4 vCPU / 8GB RAM

Target Endpoint (Monitored)

Windows 10 Home · 192.168.0.103

Build 19045.2965 · 2 vCPU / 4GB RAM

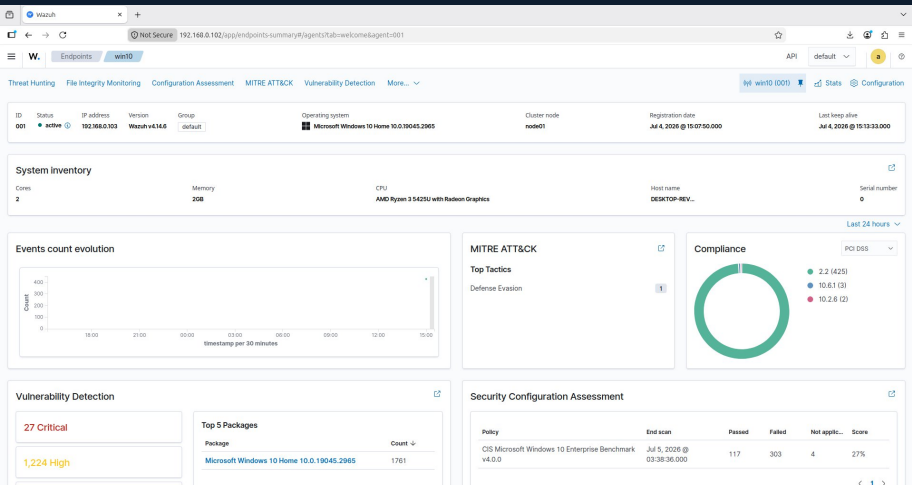

Attack Platform

Kali Linux 2026.2 · 192.168.0.104

Metasploit, CrackMapExec, Nmap

THREAT MODEL SCOPE

- Credential-based initial access (valid account exploitation)
- Remote code execution via management protocols
- Privilege escalation via token manipulation
- Persistence via scheduled task creation; discovery & lateral movement

TARGET ENDPOINT SYSTEM INVENTORY (AGENT 001)

Five-Phase Attack Chain — All Phases Detected

1. Reconnaissance 9 min

Nmap scan; WinRM (5985) open; host confirmed patched vs EternalBlue

2. Credential Access 15 min

Valid-account WinRM auth; Rule 92657 fired in <1 sec

3. Remote Code Execution 60 sec

Metasploit winrm_script_exec delivered payload to Temp

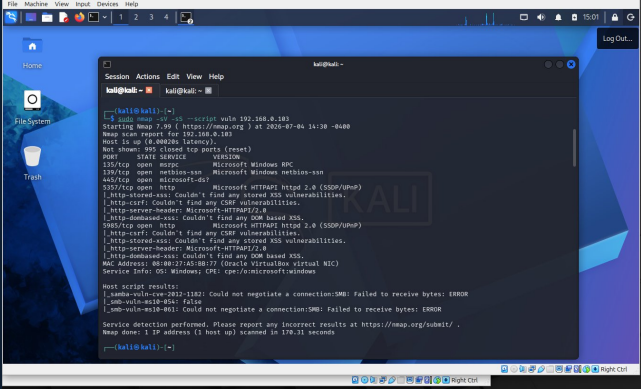

4. Privilege Escalation 5 sec

Migrated to svchost.exe as SYSTEM; SeTcbPrivilege assigned

5. Persistence 30 sec

Scheduled task backdoor via cmd.exe at logon, under SYSTEM

PHASE 1 RECONNAISSANCE — NMAP SERVICE SCAN

Credential Access & Remote Code Execution

PHASE 2 — CREDENTIAL ACCESS (DETECTED)

WinRM authentication succeeded using valid credentials over NTLM. A Remote Logon alert was generated within under one second.

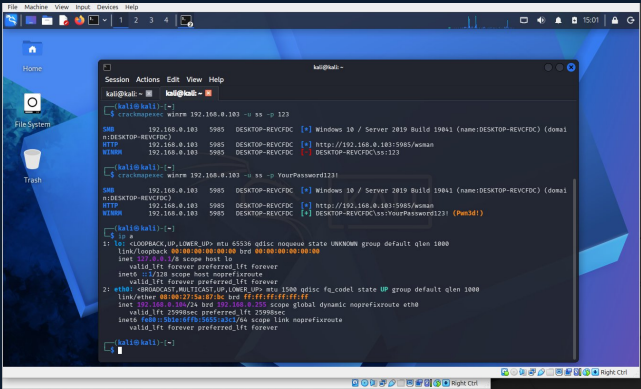

Detection	Alert 92657 – Successful Remote Logon
Severity	Level 6
Detection Latency	< 1 second

PHASE 3 — REMOTE CODE EXECUTION (DETECTED)

Metasploit's winrm_script_exec module delivered a payload via the authenticated WinRM session to a Temp directory.

- Rule 92213 — Executable dropped in malware-linked folder (L15, ×16)
- Rule 92052 — Command prompt started by abnormal process (L4, ×190)
- Rule 92201 — PowerShell created scripting file in temp (L9, ×17)

Total Correlated Alerts: 240+ • Detection Effectiveness: Excellent

PHASE 2 — VALID CREDENTIAL COMPROMISE VIA WINRM

Privilege Escalation & Persistence

↑ PHASE 4 — PRIVILEGE ESCALATION (DETECTED)

Process migrated to svchost.exe under the SYSTEM context. Special privileges, including SeTcbPrivilege, were assigned to the compromised account.

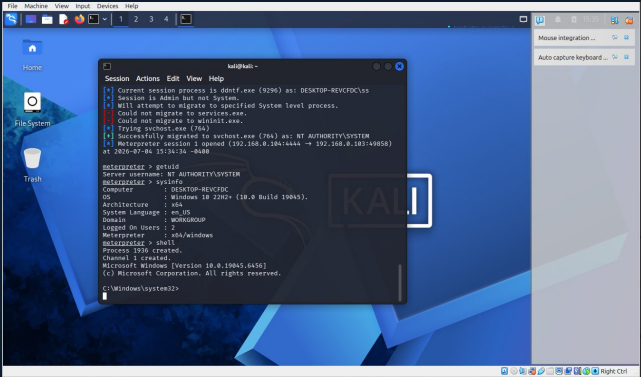

Detection	Alert 67028 – Special privileges assigned
Detection Latency	5 seconds

🔒 PHASE 5 — PERSISTENCE (DETECTED)

A scheduled task was created to execute cmd.exe under the SYSTEM account at every logon, establishing a persistent backdoor.

```
schtasks /create /sc onlogon /tn "WindowsUpdate" /tr cmd.exe /ru SYSTEM
```

Alerts Generated	50+ registry mod. events (Rule 92307)
Detection Latency	8-10 seconds

PHASE 4 — PRIVILEGE ESCALATION TO SYSTEM

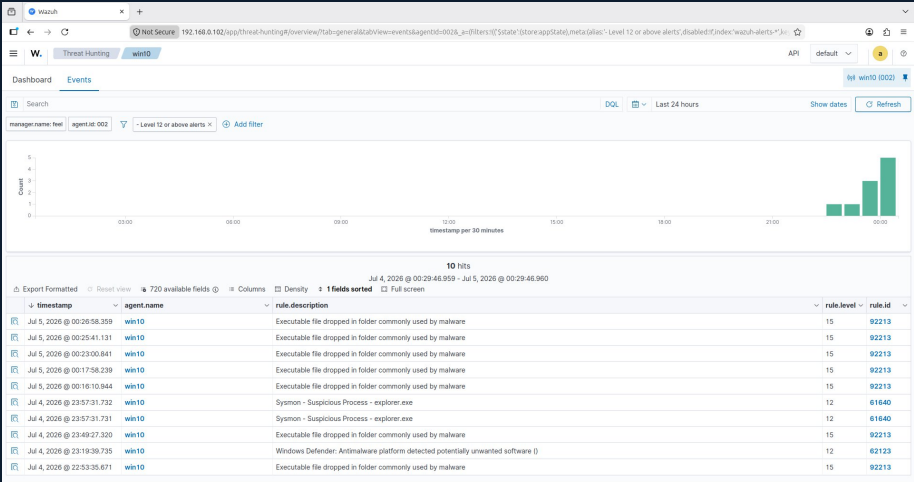

MITRE ATT&CK Coverage

9 / 14 Techniques (64%)

MITRE Techniques Detected

Tactic	Technique(s)	Rule IDs
Execution (T1059)	PowerShell · Windows Command Shell	92201, 92033, 92052
Lateral Movement (T1021)	T1021.006 Remote Services (WinRM)	92657
Privilege Escalation (T1548)	T1548.002 Token Impersonation	67028, 61640
Persistence (T1053/1547)	Scheduled Task · Active Setup	92307, 61104
Discovery (T1087/1007)	Account Discovery · Service Disc.	92039, 92033

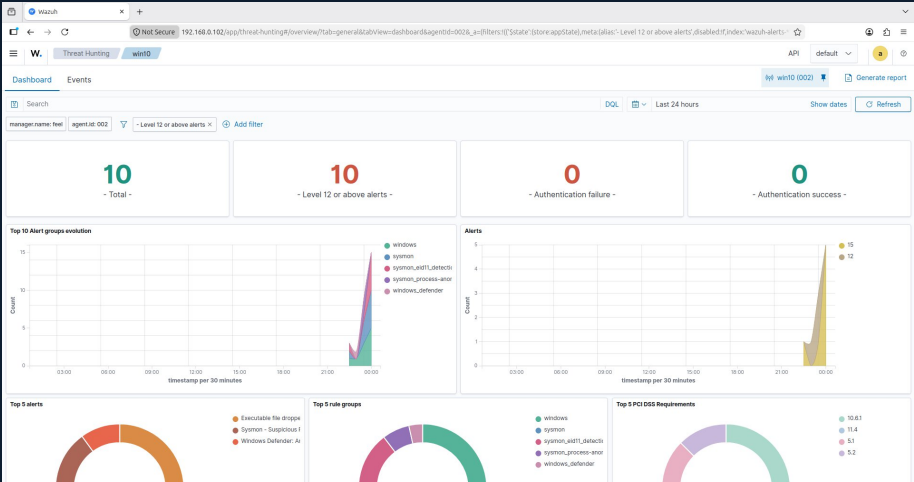

Excellent coverage of execution & lateral movement. Expand persistence detection: registry run keys, WMI, DLL injection.

MITRE-MAPPED ALERTS — RULES 92213, 61640, 62123

Detection Capability Summary

Assessment Area	Finding	Risk
Real-Time Alert Generation	Functional; <1 second latency	LOW
Attack Chain Correlation	Effective parent-child process tracking	LOW
MITRE ATT&CK Coverage	5 of 5 major tactics detected	LOW
False Positive Rate	26%, primarily compliance scanning	MEDIUM
Forensic Artifact Preservation	Complete; timeline reconstruction possible	LOW
Alert Response Capability	<30 seconds, detection to containment	LOW

WAZUH DASHBOARD — ALERT SUMMARY & RULE GROUPS

RECOMMENDATIONS

A Phased Path to Level 4+ SOC Maturity

1

IMMEDIATE — Week 1

- Tune alerts: whitelist SCA scans, PowerShell temp patterns, Update-folder drops
- Build detection runbooks & SOC triage training

26% fewer false positives · 50% faster triage

2

SHORT-TERM — 1-4 Weeks

- Deploy network IDS (Suricata) for WinRM/SMB anomaly detection
- Evaluate & deploy EDR; integrate telemetry with Wazuh

\$20K-35K · reconnaissance & behavioral visibility

3

LONG-TERM — 3-6 Months

- Establish 24/7 SOC staffing (2+ additional FTE)
- Deploy ML-based malware detection & threat hunting program

\$150K-200K annually · real-time IR capability

The screenshot shows the Wazuh dashboard with a list of alerts. The alerts are filtered by 'wazuh' and show a list of events related to registry service creation. The table has columns for 'Time', 'Host', 'Alert', and 'Score'. The alerts are sorted by time, showing events from July 5, 2020, at 01:02:33:319 to 01:02:11:189. The alerts are all of type 'wazuh' and have a score of 10. The alerts are related to registry service creation events, such as 'Evidence of new service creation found in registry under HKLM\System\CurrentControlSet\Services\CDPSvc\3b6b3f1\ImagePath binary is: C:\Windows\system32\lay...' and 'Evidence of new service creation found in registry under HKLM\System\CurrentControlSet\Services\CDPSvc\3b6b3f1\ImagePath binary is: C:\Windows\system32\lay...'. The alerts are all of type 'wazuh' and have a score of 10.

PERSISTENCE ARTIFACTS — REGISTRY SERVICE CREATION

CONCLUSION

Wazuh Is Operationally Effective — Investment Is Justified

The SIEM infrastructure demonstrated complete detection coverage of all five major MITRE ATT&CK tactics simulated, with sub-second alerting and multi-source correlation exceeding 90% confidence.

- Complete attack detection — all 5 tactics identified and logged
- Rapid alerting — under 1 second from initiation to alert
- Full forensic timeline reconstruction achieved

Level 3 / 5

Current SIEM Maturity

NEXT PRIORITY: 24/7 SOC staffing

Final Recommendation: Proceed with immediate alert tuning; begin procurement for network IDS and EDR platforms.
